Date of Submission: 10/02/2026

1. Executive Summary

This report presents strategic insights derived from an end-to-end analytics workflow conducted over three weeks.
The objective was to understand learner engagement behavior, identify drivers of application trends and student churn, and propose data-driven actions to improve retention.

The project integrates data preparation and feature engineering, exploratory data analysis, and predictive churn modeling to support operational and strategic decision-making.

---

2. Data Foundation and Analytical Scope

During Week 1, the raw learner–opportunity dataset was cleaned, validated and transformed into an analysis-ready structure.

Key engineered features included:

- learner age
- opportunity duration
- signup month and year
- days between signup and application

These features enabled temporal trend analysis, demographic segmentation and engagement modeling.

```
 ++ Feature Engineering ++
Calculating Age ==>
     Learner SignUp DateTime  ...   Age
0        2023-06-14 12:30:35  ...  21.0
1        2023-01-05 05:29:16  ...  22.0
2        2023-09-04 20:35:08  ...  21.0
3        2023-08-29 05:20:03  ...  24.0
4        2023-06-01 15:26:36  ...  23.0
```

```
Opportunity Duration ==>
     Learner SignUp DateTime  ... Opportunity_Duration_Days
0        2023-06-14 12:30:35  ...                     841.0
1        2023-01-05 05:29:16  ...                     841.0
2        2023-09-04 20:35:08  ...                     841.0
3        2023-08-29 05:20:03  ...                     841.0
4        2023-06-01 15:26:36  ...                     841.0
```

```
Signup Month & Year ==>
     Learner SignUp DateTime  ... Signup_Year
0        2023-06-14 12:30:35  ...      2023.0
1        2023-01-05 05:29:16  ...      2023.0
2        2023-09-04 20:35:08  ...      2023.0
3        2023-08-29 05:20:03  ...      2023.0
4        2023-06-01 15:26:36  ...      2023.0
```

```
Application Delay Feature ==>
     Learner SignUp DateTime  ... Days_To_Apply
0        2023-06-14 12:30:35  ...           0.0
1        2023-01-05 05:29:16  ...           0.0
2        2023-09-04 20:35:08  ...           NaN
3        2023-08-29 05:20:03  ...          12.0
4        2023-06-01 15:26:36  ...           0.0
```

3. Engagement and Application Behavior Insights

Exploratory analysis reveals several important behavioral patterns.

The learner population is dominated by young adults, with engagement behavior showing strong right-skewness.
A small group of learners exhibits very high long-term engagement, while the majority remain moderately active.

Gender participation is imbalanced, indicating potential outreach or accessibility gaps.

However, the analytical dataset was significantly reduced after cleaning, highlighting important data quality risks that must be addressed before production deployment.

4. Key Indicators Influencing Application and Engagement Trends

The following indicators were found to be most relevant for explaining application behavior and engagement patterns:

- learner age
- speed of application after signup (days to apply)
- engagement duration and intensity
- opportunity characteristics such as category and duration

Seasonal patterns observed through signup month features indicate timing effects on application activity.

5. Churn Modeling and Final Model Performance (Week 3)

A churn prediction model was developed to estimate whether a learner would drop off before completing an opportunity.

Three models were evaluated:

- Logistic Regression
- Decision Tree
- Random Forest

Due to the limited dataset size, all models achieved very high performance.
The results are therefore treated as proof of concept rather than production-ready metrics.

Logistic Regression was selected as the final model because it provides strong performance and high interpretability for stakeholders.

6. Key Drivers of Student Churn

Model interpretation and behavioral analysis indicate that churn is most strongly associated with:

- low early engagement
- overall engagement score
- specific opportunity categories
- certain age segments

Early learner activity is the strongest indicator of future completion.

```

7. Strategic Recommendations

Immediate actions

- deploy early-engagement alerts for learners with very low initial activity
- introduce guided onboarding and short learning pathways during the first days

Short-term actions

- apply category-specific interventions for programs with consistently high churn
- prioritize student support resources using churn risk scores
- design campaigns targeting underrepresented gender groups

Long-term actions

- integrate churn prediction and engagement segmentation into the platform
- redesign high-risk opportunities using behavioral feedback
- establish automated data validation rules to prevent engagement calculation errors

---

8. Limitations and Risk Considerations

The analytical dataset used for modeling is small and was produced after aggressive filtering. Negative engagement values and data anomalies indicate issues in data collection or processing.

Model performance should therefore be interpreted as exploratory and educational.

Future deployments must be conducted on a validated and significantly larger dataset.

---

9. Conclusion

This project demonstrates how data engineering, behavioral analytics and interpretable machine learning can be combined to support engagement and retention strategy.

With improved data pipelines and broader coverage, the proposed framework can evolve into a scalable decision-support system for student success.
